

Protect your most important assets, through the support of Vodafone's Managed Security Services

A rapid growth insurance brokerage holding company with over 100 offices and 7,000 employees, was looking to protect their business against rapidly evolving threats.

COVID-19 and remote working has created the perfect conditions for social engineering. Instead of trying to find a technical flaw in your company's security and trying to exploit it, social engineering can trick your employees into launching the malicious content themselves. This insurance brokerage recognised this and wanted to create a human firewall by providing their employees with the right training and awareness.

They chose Vodafone because of our network security expertise and partnership with Accenture. Having a market leader in cyber security, combined with Vodafone's deep network expertise – they knew they were in expert, safe hands.

With Vodafone's Managed Security Services team, we delivered our Phishing Awareness Programme, providing them with a phishing attack simulation to help improve the security awareness of their employees. They were surprised at how many employees clicked the link, but with this insight, they can now do something about it.

They have now been able to remind their employees about their Cyber Awareness training, and importantly teach them what to look for when they receive an email requesting them to click on a link, or a phone call asking for information. This will enable them to protect their most important assets – their people, places and data.

“The value from the Phishing Awareness service is in how many people actually clicked the link and that **we are doing something about it...**”
