

# Ensure your network is fit for purpose, through the support of Vodafone's Penetration Testing

A high-end fabric furnishing, wall coverings and interior design business wanted to ensure that their network was fit for purpose by understanding if there were any vulnerabilities.

As businesses digitise their operations and processes, they sometimes underestimate the new technology risks this exposes. This interior design business was determined not to make this mistake, and wanted to mitigate the risk of a security incident and the cost of a cyber attack. They used Vodafone's Penetration Testing Service, involving an in-depth testing process that simulates a real attack, to help discover weaknesses.

Vodafone was selected due to our expertise in networks and security, along with our ability to discover and discuss vulnerabilities, and offer remediation and fixes to ensure the customer's network is fit for purpose.

With Vodafone's Managed Security Services team, we delivered our Penetration Testing service, an in-depth manual test, which simulates an actual attack by applying the 'path of least resistance' principle. The test exploits any identified flaws to demonstrate their impact. These flaws are then prioritised for remedial actions in the final report.

The results highlighted and reaffirmed to the business any known risks in their network and they are now working with us around the mitigation of these risks – specifically the migration of the companies on premise exchange environment to exchange online and Office 365.

“I would recommend the service for any business that has a concern or question as to the **vulnerability of their external network.**”
