

**Forecasting ultrafast broadband roll out in  
the UK  
2016 to 2020**

Final 1.0

## Background

The technologies that enable high speed data delivery to consumers are continually evolving. Fibre to the premises (FTTP), G.Fast and DOCSIS3/3.1 are all capable of delivering ‘ultrafast’<sup>1</sup> bandwidths. Investment plans from Virgin Media, smaller new entrants as well as BT have all been announced, however specific detailed roll out plans have, in many cases, not been forthcoming.

Point Topic was asked by Vodafone to forecast the likely roll out of BT’s G.Fast and FTTP footprint based on its stated public positions of passing 10 million premises with G.Fast and 2 million premises with FTTP by 2020<sup>2</sup>.

This paper describes the methodology and high level outputs.

### *About Point Topic*

Point Topic is uniquely placed to provide insight. We have, since 1998, been exclusively focused on broadband around the world, in the UK and the rest of Europe. We have contributed to [Global](#)<sup>3</sup>, [European](#)<sup>4</sup>, [UK](#)<sup>5</sup> and [local data](#)<sup>6</sup> use, application and exploitation of broadband and related data for policy and profit.

Our in-depth research combined with experienced market professionals, supported by extensive GIS and mathematical modelling experience along with extensive and regular industry contact, allows access to unique data sources to support clients and help them keep their information edge.

---

1 We are using the commonly used interpretation of ‘ultrafast’, meaning a service that delivers a downstream bandwidth of 100Mb/s. However this is not a technical standard.

## Executive summary

BT has announced plans to invest in 10 million homes passed with the FTTP technology, G.Fast and 2 million premises passed with FTTP technology. BT's plans contain little detail about the availability of either technology. Vodafone asked Point Topic to forecast the likely geographic coverage of these networks. Using our existing data, models and tools, we have been able to forecast likely coverage and have been able to conclude that:

- Only 6.5% of UK homes to be covered by gigabit-capable fibre by 2020
- Only 1 out of 13 UK nations or regions will get more than 10% fibre coverage (see table below)
- A mere 96 out of 633 constituencies<sup>7</sup> will get fibre-to-the-home (FTTH) coverage above 10%
- BT's G.Fast rollout will be limited to customers living within a few hundred meters of an existing superfast street cabinet
- BT's G.Fast rollout will increase UK ultrafast household coverage by less than 5%

This analysis is based on a number of predictive scenarios, taking into account competition, previous investment roll out and likely demand.

---

<sup>7</sup> It was not possible to analyse Northern Ireland data at constituency level in this research.

## Forecast methodology

Absent specific roll out plans provided by BT for its FTTP and FTTP investment, Point Topic was asked by Vodafone to predict the likely locations of the stated network roll out. The methodology took account of three factors: BT's historic roll out plans, competitive drivers and demand.

**Learn from history:** we modelled BT's FTTC commercial deployment and assumed that G.Fast and FTTP will follow the same progress.

**Competitive drivers:** we took account of Virgin Media roll out plans.

- Point Topic uses models of the broadband and related demographic constraints by postcode to establish how many residential and business properties are using what service. We also pick out the barriers to adoption, the highs and lows of bandwidths and generate research and models on adoption and marketing through to policy tools and supporting econometric modelling for local, national and European applications.
- Using the appropriate datasets with an understanding of their geographic, temporal and methodological relationships is core to our record of success in the UK and Europe.

**Demand and supply:** Based on roll out of historic and current take up trends using our own time series, datasets and models we establish the real hotspots for adoption.

- Point Topic has built over the last 10 years considerable experience and understanding of broadband supply and adoption.
- Demand will be a driver for G.fast and other ultrafast deployments. We track where bandwidths are available and provide a view of who is supplying them today and that forms the core of the forecasts in this paper.
- Overall steps to take-up at postcode level
  - a. **Availability** (postcode level) - inputs including Ofcom postcode level datasets and Point Topic research
  - b. **Broadband Infrastructure Index** (postcode level) - our assessment of the quality of supply and competition. Updated with fibre and bandwidth additions
  - c. **Digital Deprivation Index** (LSOA level) – who isn't getting what and why
  - d. **LM3** to provide the actual number of subscribers in a postcode (postcode level).
  - e. **ISP** subscriber numbers and splits by technology (some national, some exchange, some postcode)
  - f. **Linear Programming** to establish what the benchmark market shares are (postcode level)

We then weighted every single one of the 1.5m postcodes in the UK, against these three factors. For instance a postcode location that was in Virgin Media footprint and an LLU operator would score higher than a postcode that was not in Virgin Media footprint. A location that is already in BT's superfast footprint would score higher than a location that is not.

We took account of FTTP deployment (rather than G.fast) by taking account of BT's ambition to serve business premises with FTTP and factored this into the postcode analysis accordingly.

We then calculated a combined score for each postcode for every month up to 2020 to determine the likely roll out.

## Headline analysis

We have aggregated the data at Westminster constituency, regional and national level as can be seen below.

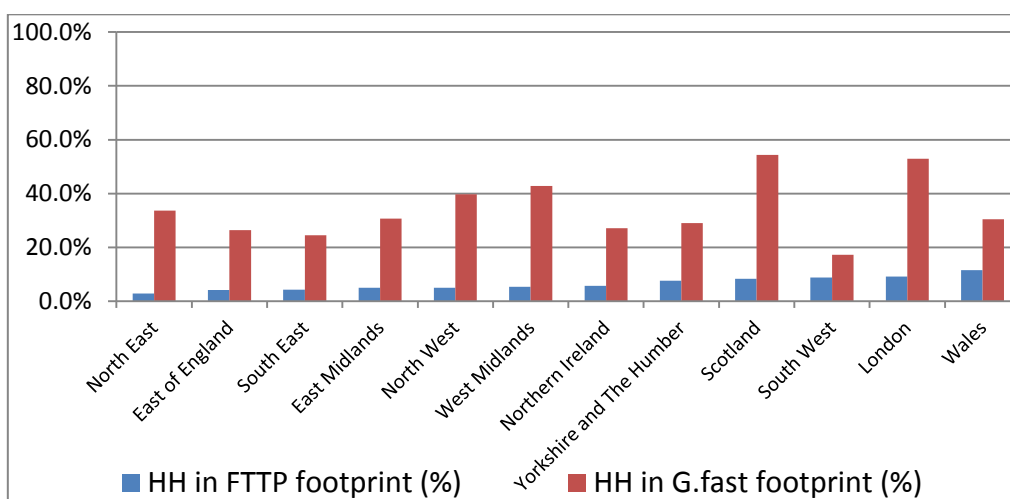

It is clear that by 2020 very little FTTP roll-out to households is expected in any of the UK nations and regions. When looking at roll-out of G.Fast to households, only Scotland receives coverage of over 50% by 2020.

**Table 1 UK Nations; roll-out of BT’s FTTP and G.Fast network to households (HH) and businesses (Bus) by 2020**

UK Nations	FTTP Roll-out by BT		G.fast Roll-out by BT	
	HH in FTTP footprint (%)	Bus in FTTP footprint (%)	HH in G.fast footprint (%)	Bus in G.fast footprint (%)
England	6%	67%	33%	33%
Scotland	8%	70%	54%	50%
Wales	12%	70%	30%	31%
Northern Ireland	6%	76%	27%	25%
<b>Total</b>	6%	68%	33%	34%

BT’s limited coverage of any form of ‘ultrafast’ broadband can be seen from the view of the nations and regions. In the South West fewer than 10% of households will receive FTTP, and only 17% will receive G.Fast. For the South East, East of England, Northern Ireland, and Yorkshire and the Humber the situation is not that much better. The North East will only receive FTTP coverage for 2% of their households, showing the picture is far worse for some areas than the national picture indicates.

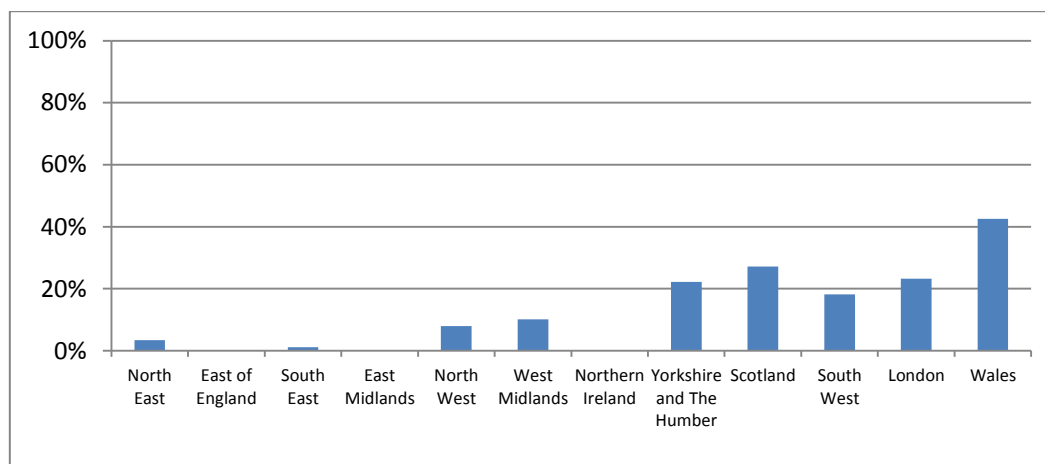

**Chart 1 Projected roll out of BT’s FTTP and G.Fast networks to 2020 by UK Nations and English regions**

Looking at the picture at a more disaggregated constituency level, the true limitations of BT’s roll-out of FTTP by 2020 can be shown. The chart below shows that for many Nations and Regions, a very

small number of constituencies will receive more than 10% FTTP coverage (in total only 96 out of 633 constituencies).

**Chart 2: Percentage of constituencies in each nation or region with FTTP household coverage above 10% by 2020**

Similarly, predicted incremental G.Fast coverage is poor in many constituencies, as BT's investment is expected to focus on competing with Virgin Media and matching its network footprint.

**Table 2 UK Predicted residential FTTP and G.Fast roll out by Westminster Constituency<sup>8</sup>**
